2. Reusable Grocery Bag

Techniques used: Role Prompting, Constraint (tone), Context
Prompt: Take the role of an excellent Entrepreneur and write a product description for a reusable grocery bag. The audience is people who shop for groceries a lot. The description is going to appear on a product description page on a website, and the tone should be exciting.

Result:

Make Every Grocery Run a Better Experience!

Say goodbye to flimsy plastic bags and hello to your new everyday shopping essential! Our Reusable Grocery Bag is designed for shoppers who want convenience, durability, and style in one simple solution.

Whether you're stocking up for the week, making a quick trip to the supermarket, or picking up a few everyday essentials, this bag makes carrying groceries easier. Its spacious interior gives you plenty of room for your purchases, while its sturdy construction is made to handle repeated shopping trips.

Why You'll Love It:

- Built for Everyday Use: Durable construction designed for repeated grocery runs.
- Room for More: Spacious storage for groceries, household essentials, and more.
- Easy to Carry: Comfortable handles make transporting your shopping convenient.
- Eco-Friendly Alternative: Reduce your reliance on single-use plastic bags.
- Reusable & Convenient: Simply bring it along on your next shopping trip.

One Bag. Countless Shopping Trips.

Make the switch to a smarter, more convenient way to shop. Keep one in your car, take one to the supermarket, and make every grocery run a little easier.

Shop sustainably. Carry confidently. Reuse endlessly!

Analysis

Throughout this assignment, I used several prompting techniques, including role prompting, context, constraints, few-shot prompting, and output format. Each technique helped improve the response in a different way.

The technique that made the biggest difference for me was role prompting. Normally, when I gave the model a generic prompt, it created a response from a general perspective. However, when I tell it to take on a specific role, such as a marketing specialist, it has a clearer direction for how it should write. I noticed this difference when comparing the first water bottle description with the second one. The first version sounded very generic, while the second version sounded more like something a marketer would write. It included better selling points, such as being easy to clean, portable, and leak-resistant, which made the description sound more marketable.

I also found context to be very effective, especially when it came to identifying the audience and where the description would appear. For example, in V3, I told the model that the water bottle was for gym-goers and that the description would be used in an Instagram post. The response became much more personal and fitness-focused. It included fitness-related language, emojis, and hashtags, which made it feel more appropriate for Instagram. I also noticed this in Part 3

with the standing desk, where mentioning that the description was for an Instagram advertisement resulted in captions, emojis, and hashtags. This showed me how providing context helps the model adjust its response to the intended audience and platform.

The other techniques also made a noticeable difference. With constraints, I asked the model to keep the water bottle description to two sentences and use language that an elementary student could understand. It followed those requirements and made the description shorter and easier to understand. With few-shot prompting, I provided an example of the style I wanted, and the model followed that example when writing the water bottle description. Finally, with output format, I specifically requested bullet points only, and the model followed that format without adding paragraphs. I also applied several of these techniques together in Part 3 of my chosen 2 products, and I liked how the results matched the requirements I provided for both the standing desk and reusable grocery bag.

For the most part, the model followed my prompt instructions and adjusted its responses based on the techniques I used. I did not experience any major instances where the model ignored my instructions or made up details that negatively affected the results.

Overall, role prompting made the biggest difference for me, with context being another technique that I found especially useful. By telling the model who it should write as and providing information about the intended audience, I was able to get responses that were more specific, personal, and effective instead of generic descriptions. These techniques helped me understand how much the quality of the output depends on how clearly I communicate what I want in my prompts.
